### **III. ABSTRACT**

Africa is a huge continent defined by its diversity in almost all domains such as cultures, vegetation, animals and so on. It is composed by 54 countries. Some people have been talking about Africa and its less importance because since the colonization period to nowadays, it is terrible to see a continent with a lot of raw material but less developed than other continents. Indeed, Africa is a wonderful continent which has so much natural resources and human resources. Africa's topography is a dramatic mosaic of plateaus, mountains, valleys, deserts, and basins that shape its climate, ecosystems, and infrastructure potential, characterized by a large, high-level plateau, generally higher in the east and the south, and slope down towards the west and north. Africa's climate is diverse, primarily dominated by high temperatures and characterized by a range of zones including equatorial, tropical wet and dry, semi-arid, and desert climates, with rainfall amount and seasonality being more significant factors than temperature in distinguishing these climates. Africa is the second most populous continent. It is also important to note that Africa is the youngest continent and the population growth is so rapid. The main economic activity practised in Africa is agriculture which refers to the exploitation of the ground in order to obtain some food, and it is an evidence because the environment is generous in the cases where the ground is fertile, the climate varies, which is great for all kind of plants, and there is a lot of people who can practise it, but unfortunately, farms are usually located at villages and people leave villages for cities and therefore, agriculture becomes useless. One of the main issue in Africa nowadays is the reduction of its population from the villages, and that is what we call rural exodus which refers to the general moving of people from villages to urban areas for some reasons. We have several reasons which explain why people move from village to cities and the most important is rural unemployment because they think we can have a salary only by the government, in addition, we have the healthcare where in rural areas, the technology is less-advanced so that hospitals cannot provide a complete service, furthermore, we have the education where schools don't exist or are very old, no teacher, no science research, just traditional rituals and cultures, and the last important reason of rural exodus is the infrastructure and cultural factors where infrastructures we meet in remote areas are poor or non-existent. This movement creates mess over almost all domain with

consequences in economy where nobody is going to practice agriculture and consumer bases for local businesses are reducing, in demography where the population of Africa tends to be old with aging populations and higher dependency ratios which places increased strain on healthcare and social services, and in social domain where there is loss of traditional knowledge and cultural practices causing land abandonment. WAN and Cloud Services represent potential solution where WANs are telecommunication networks which cover a large geographic zone by connecting LANs and making possible exchange of data over long distances, including 4G and 5G cellular networks and satellite internet with LEO satellites ensuring broadband connectivity. Together, they enable remote work, telemedicine delivering specialist healthcare consultations to rural patients, and distance education providing rural students with access to world-class educational resources through cloud-based learning platforms.

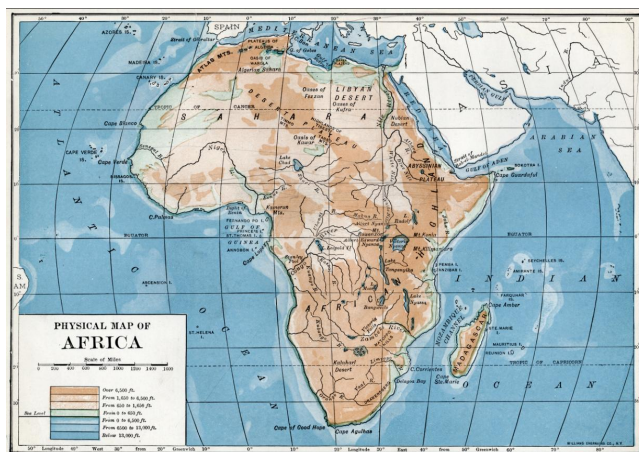

## IV.INTRODUCTION

Africa is a huge continent defined by its diversity in almost all domains such as cultures, vegetation, animals and so on. It is composed by **54 countries** which are **Algeria, Angola, Benin, Botswana, Burkina Faso, Burundi, Cabo Verde, Cameroon, CAR, Chad, Comoros, DRC, Republic of the Congo, Ivory Coast, Djibouti, Egypt, Equatorial Guinea, Eritrea, Eswatini (Swaziland), Ethiopia, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Liberia, Libya, Madagascar, Malawi, Mali, Mauritania, Mauritius, Morocco, Mozambique, Namibia, Niger, Nigeria, Rwanda, São Tomé and Príncipe, Senegal, Seychelles, Sierra Leone, Somalia, South Africa, South Sudan, Sudan, Tanzania, Togo, Tunisia, Uganda, Zambia, and Zimbabwe**. Some people have been talking about Africa and its “ less importance ” because since the colonization period to nowadays, African are for white people nigger which refers to analphabetic black people. That is a little bit true in some way because it is terrible to see a continent with a lot of raw material (natural resources) but less developed than other continents. Indeed, Africa is a wonderful continent which has so much natural resources (vegetation) and human resources (young people). In the following lines, we are going to examine all those aspects, in order to figure out the problem and give solutions which will reduce or better, avoid that.

### 1. Physical Aspect

#### a) Location

Africa's exact geographical location is between approximately **37°21' N** and **34°51'15" S** latitude and between **17°31'13" W** degrees and **51°27'52" E** longitude, bordered by **the Mediterranean Sea to the north, the Atlantic Ocean to the west, the Red Sea and Indian Ocean to the east, and the Indian and Atlantic oceans to the south**. The area of this continent is approximately **30 365 000 km<sup>2</sup>**.(1)

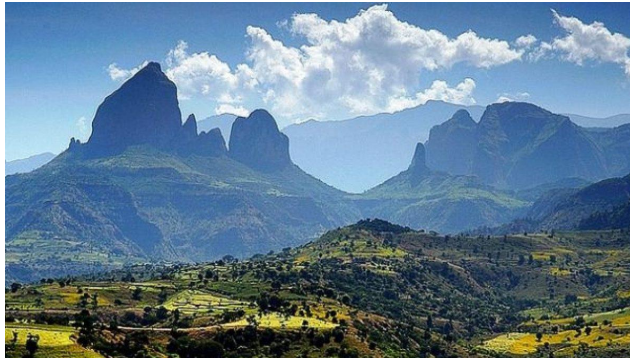

Source: Geography Of Africa,  
[https://en.wikipedia.org/wiki/Geography\\_of\\_Africa#:~:text=Africa%20is%20a%20continent%20comprising,7%2C400%20km%20\(4%2C600%20mi\)](https://en.wikipedia.org/wiki/Geography_of_Africa#:~:text=Africa%20is%20a%20continent%20comprising,7%2C400%20km%20(4%2C600%20mi),), 10/16/2025

#### b) Topography and Landforms

Africa's topography is a dramatic mosaic of plateaus, mountains, valleys, deserts, and basins that shape its climate, ecosystems, and infrastructure potential. Here's a structured breakdown:

- **Plateaus:** characterized by a large, high-level plateau with some areas reaching altitudes over 3 000 meters. These plateaus are generally higher in the east and the south, and slope down towards the west and north. As an example, we have The Ethiopian Highlands, often called the "Roof of Africa." Formed by ancient volcanic activity, they feature rugged terrain, deep valleys, and peaks like Ras Dejen (4,550 m), Ethiopia's highest point. The highlands are cooler and wetter than surrounding areas, support dense agriculture (2).

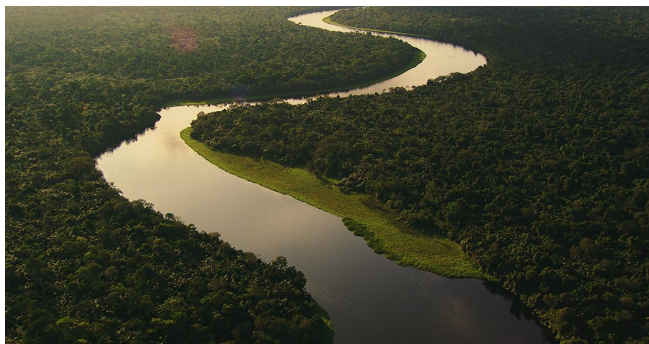

Source: Africa Defined,  
<https://africadefined.com/2021/05/05/the-ethiopian-highlands/>, 10/16/2025

**Mountains:** for example here, we have the **Mount Kilimanjaro** (which is Africa's tallest mountain, standing at **5,895 meters**) or the **Mount Kenya** (which is the second-highest mountain in Africa, rising to **5,199 meters**).

Source: Mount Kenya,  
[https://en.wikipedia.org/wiki/Mount\\_Kenya](https://en.wikipedia.org/wiki/Mount_Kenya) ,  
 10/16/2025

- **Basins:** a low-lying area of land where water naturally collects, often surrounded by higher terrain. It can be formed by tectonic activity, erosion, or glacial movement. Basins typically host rivers, lakes, or wetlands and serve as important drainage areas. For example, we have the Congo Basin (Central Africa).

Source: Bezos Earth Fund,  
[https://www.bezosearthfund.org/uploads/transforms/1200x630\\_crop\\_center-center\\_82\\_none/22-037\\_EFD\\_2022-10-13\\_WHY-CONGO-BASIN\\_THUMBNAILS\\_16X9\\_1.png?mtime=1676486681](https://www.bezosearthfund.org/uploads/transforms/1200x630_crop_center-center_82_none/22-037_EFD_2022-10-13_WHY-CONGO-BASIN_THUMBNAILS_16X9_1.png?mtime=1676486681), 10/16/2025

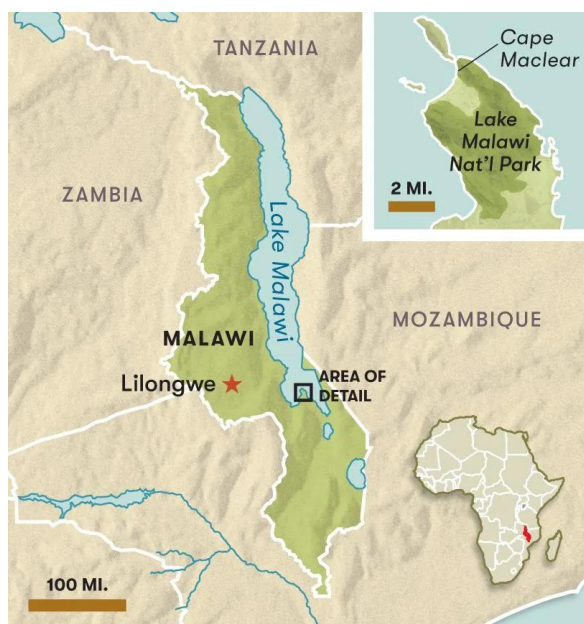

**Deserts:** is a dry, barren region where rainfall is extremely low, Deserts can be hot, like the **Sahara** (the world's largest hot desert, spanning a vast area of North Africa with an area of 9.2 million km<sup>2</sup>, with a temperature which can exceed 50<sup>0</sup> Celsius) (3), or cold, like the **Gobi** (a vast, cold desert and grassland region in Central Asia, covering an area of approximately 1.3 million Km<sup>2</sup> with temperature less than 40<sup>0</sup> Celsius) (4), and they often feature sand dunes, rocky plateaus, or gravel plains.

Source: tour in the sahara desert, <https://www.onthegotours.com/repository/Sahara-Site-Image-273691446225056.jpg>, 10/16/2025

- **Rift Valley:** The Great Rift Valley is a major tectonic feature stretching across East Africa. It is characterized by deep trenches, volcanoes, and a series of large lakes. As an example, we have the **Lake Malawi**, located in Malawi, Mozambique and Tanzania, it is the second deepest lake in Africa with a maximum depth of approximately 700 meters (5).

Source: Fishy mystery of Malawi Lake, [https://th-thumbnailer.cdn-si-edu.com/yy9XBot-kKOAHy5LN2BId2JOakA=/fit-in/1072x0/https://tf-cmsv2-smithsonianmag-media.s3.amazonaws.com/filer/bb/54/bb54d4cc-b823-44b4-b689-9087a749aa5c/mar2019\\_g99\\_malawi.jpg](https://th-thumbnailer.cdn-si-edu.com/yy9XBot-kKOAHy5LN2BId2JOakA=/fit-in/1072x0/https://tf-cmsv2-smithsonianmag-media.s3.amazonaws.com/filer/bb/54/bb54d4cc-b823-44b4-b689-9087a749aa5c/mar2019_g99_malawi.jpg), 10/16/2025

## c) Climate and Weather Patterns

Africa's climate is diverse, primarily dominated by high temperatures and characterized by a range of zones including equatorial, tropical wet and dry, semi-arid, and desert climates. Rainfall amount and seasonality are more significant factors than temperature in distinguishing these climates. Here are regional climate patterns (6):

- **North:** dominated by an arid desert climate with high temperatures and low rainfall.
- **Equatorial Africa:** features a hot and humid equatorial climate with heavy, seasonal rainfall and dry seasons that vary by location.
- **East Africa:** characterized by distinct dry and rainy seasons, with rainfall heavily influenced by shifting monsoon trough.
- **Southern Africa:** more temperate in the south, with varied climate zones including semi-arid desert regions. Here is also storms, extra-tropical cyclones.
- **Mediterranean Fringe:** the northern and southern tips of the continent experience a Mediterranean climate with dry summers and wet winters.

## 2. Demography

Africa is the second most populous continent with 1.56 billion people of this October 2025 which represent around 18.8% of the global population (7). The Fig1 shows us the population of some continents:

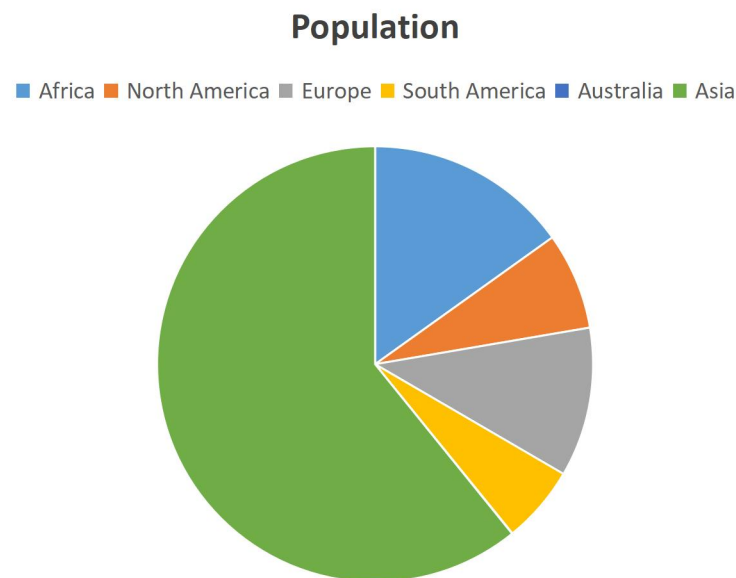

Fig1: Population of Africa and other continents

It is also important to note that Africa is the youngest continent, with a median age of around 19.3 years, which is significantly lower than the global median which is 30.9 years (8) and, the population growth is so rapid (9). The Fig2 is going to show us

the

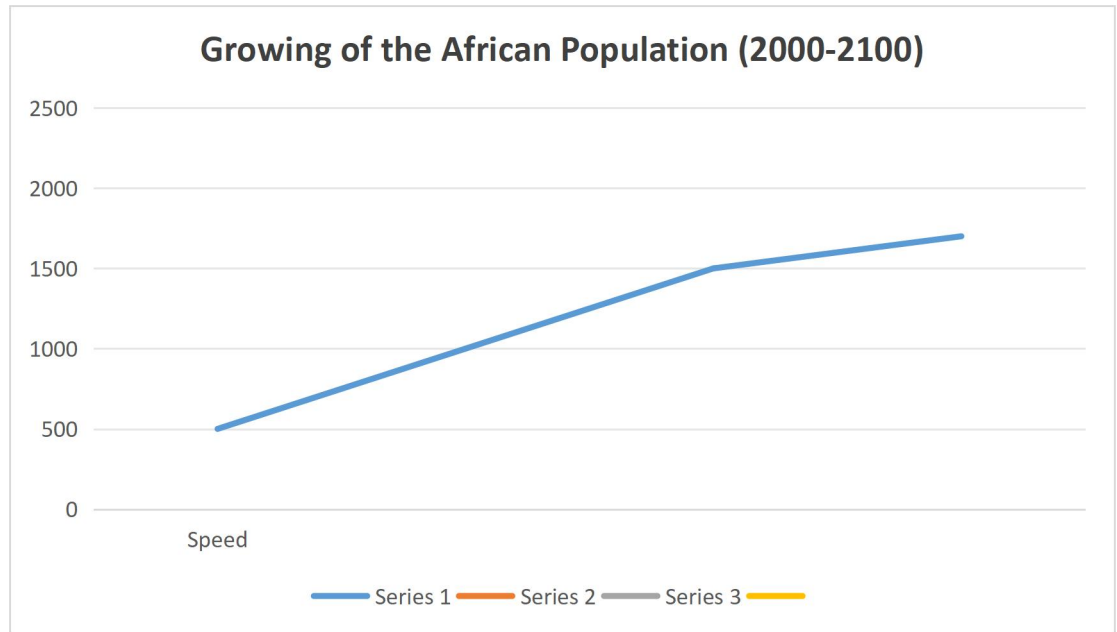

Fig2: Growing of the Population of Africa

### 3. Economy

In this part, we are going to talk about the main economic activity practised in Africa, **agriculture**. Agriculture refers to the **exploitation of the ground in order to obtain some food**. In the other side, we cannot deny that Africa lives also by breeding or mining, but in most cases, we talk about agriculture. It is an evidence because the **environment is generous in the cases where the ground is fertile, the climate varies, which is great for all kind of plants, and there is a lot of people who can practise it**. But unfortunately, farms are usually located at villages and people leave villages for cities and therefore, agriculture becomes useless, while it performs solid spark of development.

## V. RURAL EXODUS: A REAL SOCIAL SCOURGE

One of the main issue in Africa nowadays is the reduction of its population from the villages. And that is what we call rural exodus. Typically, rural exodus refers to the general moving of people from villages to urban areas for some reasons.

In fact, it is not new because industrialization in the 18<sup>th</sup> and 19<sup>th</sup> centuries pushes us from agriculture area to factory, in order to transform raw material into modern tools or foods we can consume. As an example, we have the slave trade period (10) and as far it went, this habit gradually went also far, and then African completely forgot the treasure of a field.

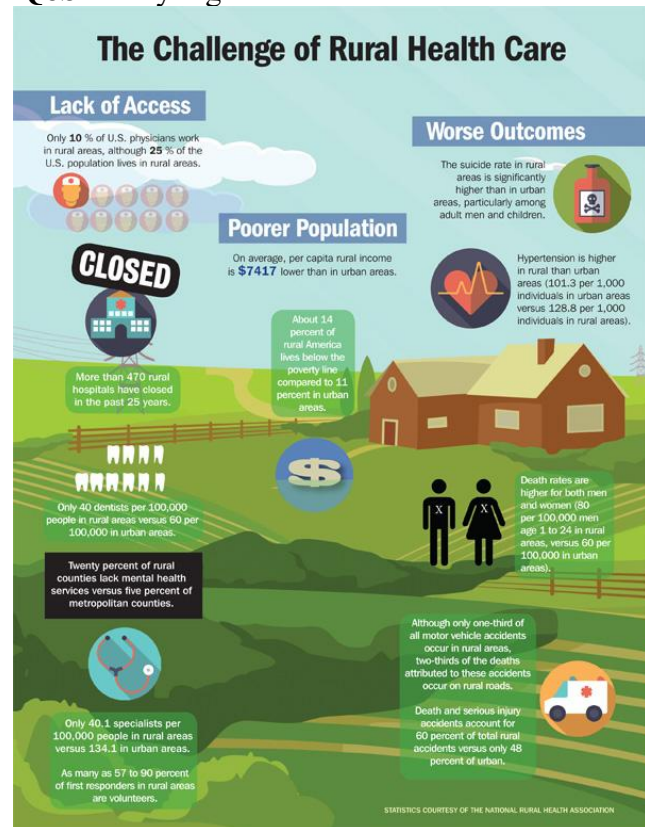

### 1. Causes

We have several reasons which explain why people move from village to cities and the most important is **rural unemployment**. Because they think we can have a salary only by the government, so that the behave like they must go to cities in order to

be satisfied. But now, the problem of this problem is that, there is no anymore space, the system is overloaded due to the amount of people (11).

In addition, we have the **healthcare**. In rural areas, the technology is less-advanced so that hospitals (or should I say clinics) cannot provide a complete service to a customer, who delight to be cure. The only way to correct that is cities, where technology is more advanced and the **QoS** is very high.

Source: Challenge of rural health care,  
[https://www.embs.org/wp-content/uploads/2016/12/rural\\_health\\_care-2608447.jpg](https://www.embs.org/wp-content/uploads/2016/12/rural_health_care-2608447.jpg),  
 10/16/2025

Furthermore, we have the **education**. Schools don't exist or they are very old, no teacher, no science research, just traditional rituals and cultures. Of course we must not forget where we do come from but it doesn't mean that there is no place for education. It is the 'transport' for evolution and without education, we cannot improve somewhere.

The last important reason of rural exodus is the **infrastructure and cultural factors**. Nowadays people like more occidental cultures than yours itself. Furthermore, the infrastructures we meet in remote areas are poor or non-existent. For example, cell tower, or electricity lines, or even road, railway line are very rare. At this point people are right to move hence. But we cannot move all and leave a good earth without caring about.

## 2. The Most concerned

The most concerned people in this embarrassing situation is the **youth**. Why them? Because they must care about their future, they have long lives in front of them and they are able to work while old men are unable to work hard like a young man, meaning that people who travel from remote to urban areas are more than 80% young people.

## 3. Consequences

This movement creates mess over almost all domain, not just for now but for so many years in the future. Remember that we are developing the world and with nobody to do that yet, we are going not only to waste time and resources but also create some stuffs which will break down the development if we do. Here are some consequences which can really impact negatively the nature and human being:

- **Domain of economy:** first of all, nobody is going to practice agriculture, the consumer bases for local businesses, closure of essential services and declining tax revenues for local governments are reducing, probably disappearing gradually (12) actually manifested by less demand (nobody could buy something).
- **Domain of demography:** the population of Africa tends to be old. This phenomenon is evident because if young people move from there, the rest will be essentially above 40 years old. This result is aging populations with higher dependency ratios, which places increased strain on healthcare and social services while reducing the workforce and entrepreneurial capacity in rural areas (13).
- **Domain of social:** as I said previously, by moving straight to another culture, we might forget our cultures, lose our traditional knowledge and cultural practices. This is what we call land abandonment and is going to cause some natural disasters such as wildfire, or water flooding, depending on the locality (14).

After pronouncing and listing all those consequences, we become able (more than before) to understand that the social scourge rural exodus is very powerful and can destroy an area which is Africa for this instance if nobody cares about and regardless mistakes we can make during the process of fixing this problem, we can move forward a lot if we become aware of the situation and all tools we have in order to get out of there.

## VI. WAN & CLOUD SERVICES: POTENTIAL SOLUTION

During the evolution of the planet, the human being has learned more about how to get routine tasks automated and that's how IT technologies, precious of modern times, has made up, efficient and fast. For this instance, we are talking about rural exodus in Africa which can be solved using WAN and Cloud Services. On the following lines we are going to talk about WAN and Cloud Services, how they can solve this problem and what are their weaknesses.

### 1. WAN

WANs are telecommunication networks which cover a large geographic zone by connecting LANs to one another and making possible exchange of data over long distances.

The first appearance of WAN technologies is leased lines and MPLS networks, where data are transmitted over **copper cable by electrical signal** and which is too much expensive and often unavailable in remote areas. After that we saw optical fiber cables, which transmit data **as light signal, through glass or plastic fibers** so that it offers high bandwidth and low latency, but the problem with this is that it is not present (due to cost) in rural areas (14).

Source: cell towers, <https://capacityglobal.com/wp-content/uploads/2025/09/image-2147483647-677.jpg>, 10/20/2025

This technology includes also **4G and 5G cellular networks**. Here data is transmitted as **RF waves** between cell towers and users devices, offering the advantage of covering large areas without requiring physical cables to each location (15). This solution is ideal for money saving, for the greatness of economy.

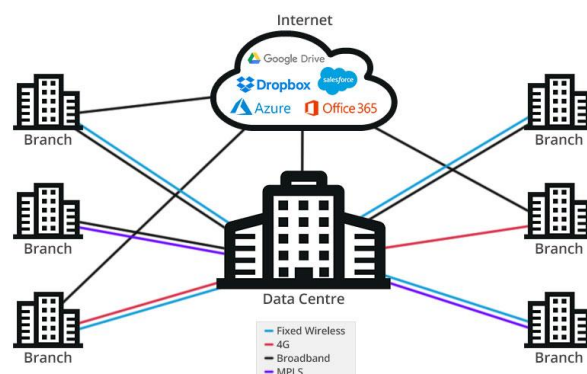

Talking about wireless technologies, we cannot forget **satellite** which has also evolved very quickly. Traditionally, we have the geostationary satellites, located around 35 000 km above the Earth, with a role of transmission of internet but its problem is low latency because the signal has to travel a long distance. The aeronautic enterprise **SpaceX** of **Elon MUSK** got it and to solve that, they launched many **LEO** (around 200 - 2000 km above the Earth) satellites in the space for internet connection. This ensure broadband connectivity with a high speed connection (16).

Source: What is Starlink, <https://starlink.com/videos>, 10/16/2025

SD-WAN, another smart and efficient technology which consists to allow big enterprises to use multiple connection types simultaneously and route packets based on application requirements, cost and availability (17).

Source: What is SD-WAN, <https://www.apcsolutionsuk.com/wp-content/uploads/2021/02/SD-WAN-Diagram.jpg>, 10/16/2025

## 2. Cloud Services

**Cloud services** are application and infrastructure resources that exist on the Internet. Third-party providers contract with subscribers for these services, allowing customers to leverage powerful computing resources without having to purchase or

maintain hardware and software. It provides on-demand access to computing power, storage, databases, networking software and analytics. The NIST has its specific definition of cloud services which is a composition of 5 characters: **on demand self-service, broad network access, resource pooling, rapid elasticity and measured service** (18).

It is divided into **03** main service models which are **IaaS** which provides fundamental computing resources such as **processing power, storage and networking**, **PaaS** which offers **development and deployment environments to build applications** and **SaaS** which provides fully functional **applications over the internet, eliminating the need for local installation and maintenance**. (19)

### 3. Cloud Computing: How can it solve the problem?

#### A) The Synergy Between Cloud and WAN

Cloud services and WAN infrastructure have a symbiotic relationship because cloud, in order to run well, needs reliable, high bandwidth connectivity while improved WAN creates demand for cloud services. Together, they can make possible what was considered in the past as impossible, futuristic stuffs in rural areas.

Thanks to them, **remote works** become feasible when workers can reliably access their organization's network, data and applications via a host in the cloud. Here is what we call **cloud computing**. **Telemedicine**, these days is almost everywhere thanks again to cloud and WAN services. It can deliver specialist healthcare consultations to rural patients when high quality video conferencing and access to cloud-based medical records are available. **Distance education** also included, can provide rural students with access to world-class educational resources through cloud-based learning platforms with just a computer (this is incredible because a rural person can challenge other students around the whole world). This increases the sharing of knowledge, which is a good path for unequal development (20).

Moreover, this synergy enables **rural businesses to access global markets**, participate in distributed chains supplied and leverage advanced analytic and AI capabilities, what was totally impossible before. These technological links re-design the world economy by diversification and innovation in remote areas (21).

### 4. Mechanism for Addressing Rural Exodus

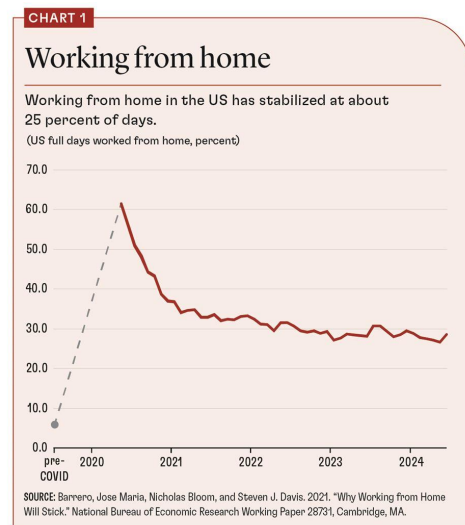

- **Enabling remote work and distributed workstations**: the development of remote work represents in some way, the most direct mechanism by which cloud services and WAN can address the social scourge rural exodus. For example, during the **COVID - 19 period**, remote work got spread but remained a minority practice. However, during **2020 and 2021**, the proportions of workers which work from home increased dramatically, demonstrating both feasibility and productivity of remote arrangements (22). As example, we have Remote.co, a company which spread little enterprises where it is possible to work from home. Their website is <https://remote.co/>.

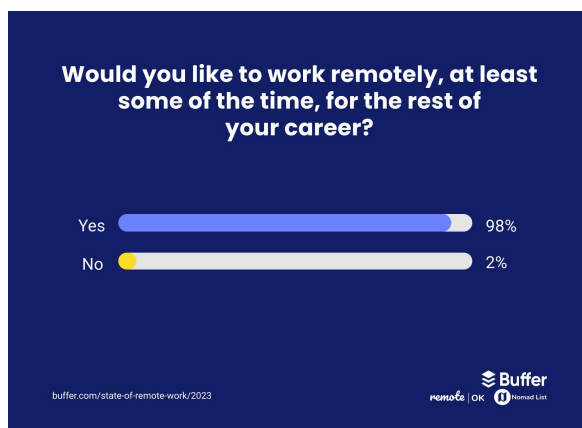

Source: remote work,  
[https://www.investopedia.com/thmb/qWzfHRHlBq1Yd8kH4L-RcQw9ZPU=/1500x0/filters:no\\_upscale\(\):max\\_bytes\(15000\):strip\\_icc\(\)/GettyImages-1369954837-c20e50f4994d43309e9cbe5820573b07.jpg](https://www.investopedia.com/thmb/qWzfHRHlBq1Yd8kH4L-RcQw9ZPU=/1500x0/filters:no_upscale():max_bytes(15000):strip_icc()/GettyImages-1369954837-c20e50f4994d43309e9cbe5820573b07.jpg) , 10/24/2025

Source: working from home, <https://www.imf.org/-/media/Images/IMF/FANDD/Charts/2024/09/bloom-chart1-v3.ashx?w=950> , 10/24/2025

Cloud-based collaboration platforms such as **Github, Microsoft 365, Google Workspace or Zoom** became great infrastructure for distributed teams, They provide some services like **email, document sharing, video conferencing, project management and communication tools** accessible from everywhere around the global with a connection to internet. Talking about money saving, it is great for those who gets a salary of a urban worker (urban life is expensive) while he works without leaving his house and enjoying lower costs (rural life is cheaper) and high quality (fresh products) (23). Furthermore, many workers keep working remotely with arrangements at least part-time in order to make some times for other occupations like holidays with family or other work.

Source: insight keys, remote work,  
<https://buffer.com/resources/content/images/2023/02/Career-RemoteWork-Buffer-StateofRemoteWork-2023.png> , 10/24/2025

Several companies have recruited remote workers through programs that offer financial incentives, co-working spaces and community support. As an example, Tulsa Remote provides 10 000 Dollars grants to remote worker (24). Similar programs have emerged almost everywhere in America, recognizing remote workers as an economic development opportunity. The economic impact of remote worker immigration can be significant. These individuals typically earn higher incomes than the local median, spend money in local business and may start their own entrepreneurship in their native locations.

- **Transforming healthcare access via telemedicine:** this domain represents a real challenge in Africa, especially in remote areas because rural hospitals have been closing at alarming, leaving communities without local emergency services. Therefore long travel distances to healthcare facilities impose significant cost, time and in the worst case health outcomes. Telemedicine, powered by cloud services and high speed of internet offers partial solution for this problem. Nowadays, it is possible mental health counseling, prescriptions managed remotely and certain types of physical examinations using specialized equipment in local clinics connected to distant specialists by Telehealth platforms (25).

Source: pros and cons, telemedicine,  
<https://www.pragmaticcoders.com/blog/pros-and-cons-of-telemedicine> , 10/24/2025

- **Revolutionizing education and lifelong learning:** this is the most important driver of rural exodus, especially for young people seeking higher education and specialized training (in computer networking for example or renewable energy). Cloud and WAN can help address this by bringing educational resources to rural areas and enabling rural students to access opportunities without any moving

## 5. Deployment

### A) Infrastructure Investment Strategies

This is absolutely not easy to apply because of money or bureaucratic reasons but it is possible. In order to have adequate WAN infrastructure to support cloud service adoption, we need to address sustainable infrastructure gap, strategic public

investment combined with innovative deployment models which is all possible by the principal actor, the Government.

National broadband strategies should establish universal service goals, with minimum service levels and commit to funding necessary to achieve these targets. It must include technology and application (newest), enough speed (at least of **100 Mbps** per user terminal for downloading and **20 Mbps** for uploading) (26).

### **B) Support for Organizational Adoption and Capacity Building**

Alone, it is a little bit impossible to realize all this, even with the infrastructure. Therefore, rural organizations need support to effectively adopt and utilize cloud services. In fact, something we call **extension services** do exist and it used for example in the case where we want it for rural businesses, governments, schools, and healthcare facilities. Technology extensions agents could help organizations assess needs, select the right cloud... This approach has been successful in various contexts and could significantly accelerate rural technology adoption (27).

### **C) Healthcare Policy Reform**

Realizing telemedicine's potential requires policy changes, addressing reimbursement, licensing, regulation and integration with traditional healthcare delivery. We have to make sure that insurance reimbursement compensate providers for telemedicine services. Previously, many insurers and government health programs reimbursed telemedicine at lower rates than in-person care or limited reimbursement to specific geographic areas or originating sites. For example, COVID - 19 has prompted temporary policy changes that should be made permanent and expanded. Payment parity, reimbursing telehealth equivalent to in-person care for comparable services and removes financial disincentives to adoption (28).

### **D) Education System Innovation**

In fact, education policies and blended learning have to be together as components of rural education strategy, while targetting quality, equity and effectiveness concerns. In the same way, graduation requirements must converge with online learning, virtual schools and blended instruction. It is the role of state education agencies have to provide tutorials, guidance, quality standards and accountability frameworks for online education, ensuring rural students receive high quality instruction more efficient than traditional schooling (29).

### **E) Economic Development Strategies**

In order to **attract massively remote workers, support entrepreneurship and enable business growth**, rural economic development must leverage cloud services and WAN infrastructures. Remote worker programs can be formalized and scaled. Remote workers who willing to relocate to rural areas might benefit tax credits, relocation grants, housing assistance and support services. All this has one principal goal, making locations attractive to knowledge workers (30).

### **F) Community-Led Development Approaches**

As I said previously, we must be **together** to make our dream, which is make Africa taller come true. This path concerns community engagement, local leadership and development strategies reflecting local priorities and values. One of the main

causes of failure of a project not only in Africa but also in other continents is the useless of non-existence of team, they don't work together.

## VII. Future Directions and Emerging Technologies

### A) 5G and Beyond

5G wireless technology promises transformative capabilities including **ultra high bandwidth**, extremely **low latency**, and **massive device connectivity**. While initial 5G deployment focuses on urban areas, eventual rural deployment could enable applications currently impractical with existing technologies (31). However, 5G deployment economics in rural areas remain challenging. **The technology requires denser network infrastructure than previous generations**, potentially making rural deployment even more economically difficult than current 4G LTE. Policy intervention, innovative business models, or alternative technologies may be necessary to bring 5G's benefits to rural areas (32).

### B) AI and Machine Learning

Cloud-based AI and machine learning services are becoming increasingly accessible, offering capabilities that could benefit rural organizations and communities in numerous ways. AI-powered analytics can help rural **businesses optimize operations, predict demand, and identify opportunities** from data previously too complex to analyze manually. Agricultural applications include crop disease detection from images, yield prediction, and autonomous equipment operation healthcare application include diagnostic support, treatment recommendations and patient risk stratification (33).

## VIII. CONCLUSION

Welcome in the end of the document, I hope you enjoyed greatly about this technique which is going to solve Africa from the social scourge called rural exodus. First of all we made a global description of this continent (the topography and demography), then figured out the problem, which is rural exodus, its causes and consequences and finally, we talked about its solutions which is about cloud services and WAN infrastructure. We now are able to notice that Africa can challenge all other continents if we work together and become smarter than the colonization period.
